## Physicists and the financial markets

By Stephen Foley

Physicists have been lured into the financial market for decades, prized for their insights and data-crunching skills. But in a time of turbulence, flash crashes and high-frequency trading, can they really spot things that others miss?

Economics

Economic Complexity

*“It is the great multiplication of the productions of all the different arts, in consequence of the **division of labour**, which occasions, in a well-governed society, that universal opulence which extends itself to the lowest ranks of the people.”*

Adam Smith – The Wealth of Nations

# Classic Theories (Smith, Ricardo) Efficiency and Specialization

# Most diversified countries are the most competitive countries!

Germany, USA, China, Italy, UK,  
France, Spain, India, Japan, ...

Database COMTRADE  
Year 2010

Evidence for leading role of  
**DIVERSIFICATION** with respect to  
competitive advantage (specialization)

BIO: Adaptation, Ecosystems, Evolvability

Key challenge

from qualitative to  
quantitative

**NEW METRICS FOR THE COMPETITIVENESS  
OF COUNTRIES AND THE COMPLEXITY OF  
PRODUCTS**

1. a product is produced by a diversified country
2. a product is produced by a poorly diversified country
3. a country produces a widely diffused product
4. a country produces an exclusive or non-ubiquitous product

1. little insight in the complexity of the product.
2. very informative.
3. little insight in the fitness of the country.
4. very informative on the country fitness.

## NON-LINEAR COUPLING BTW FITNESS OF COUNTRIES AND COMPLEXITY OF PRODUCTS

# MEASURING INTANGIBLE PROPERTIES

New metrics for **Fitness** of countries and **Complexity** of products

## Fitness

$$\tilde{F}_c^{(n)} = \sum_p M_{cp} Q_p^{(n-1)}$$

$$F_c^{(n)} = \frac{\tilde{F}_c^{(n)}}{\langle \tilde{F}_c^{(n)} \rangle_c}$$

$F_c$ : diversification weighted by complexity

## Complexity

$$\tilde{Q}_p^{(n)} = \frac{1}{\sum_c M_{cp} \frac{1}{F_c^{(n-1)}}}$$

$$Q_p^{(n)} = \frac{\tilde{Q}_p^{(n)}}{\langle \tilde{Q}_p^{(n)} \rangle_p}$$

$Q_p$ : Extremal non-linear complexity of products.  
A **single low fitness producer** implies low complexity

**Intensive** definition correlates with **intensive** measure of wealth

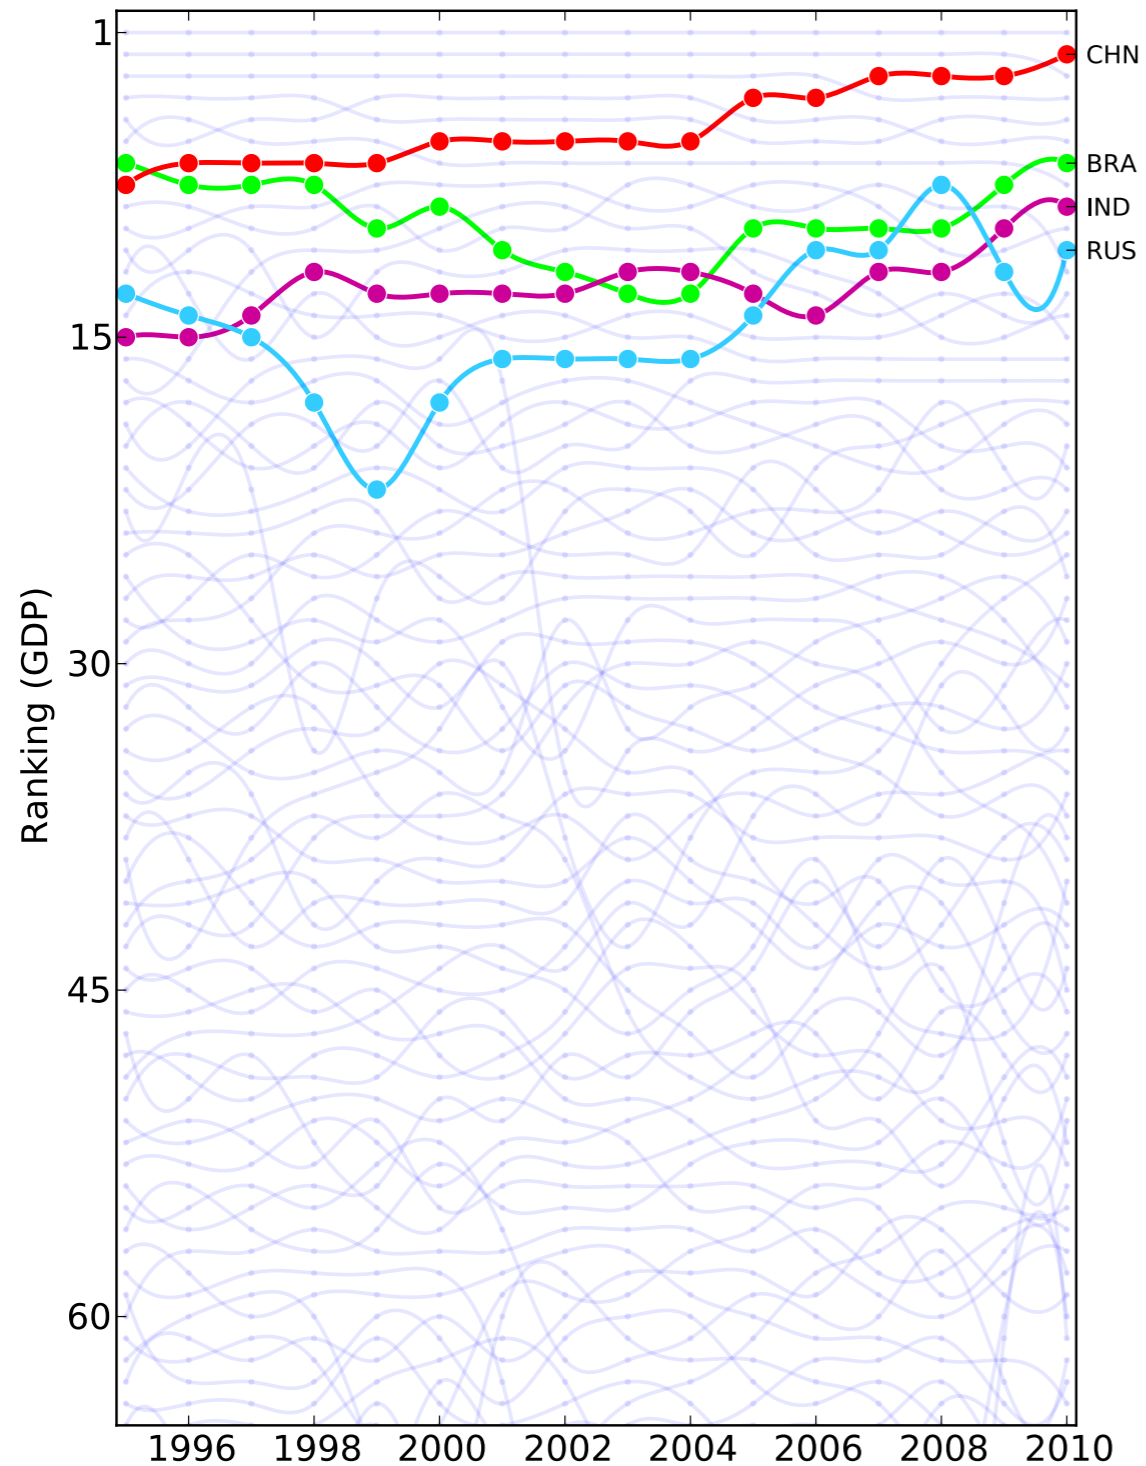

**Extensive** definition correlates with **extensive** measure of wealth

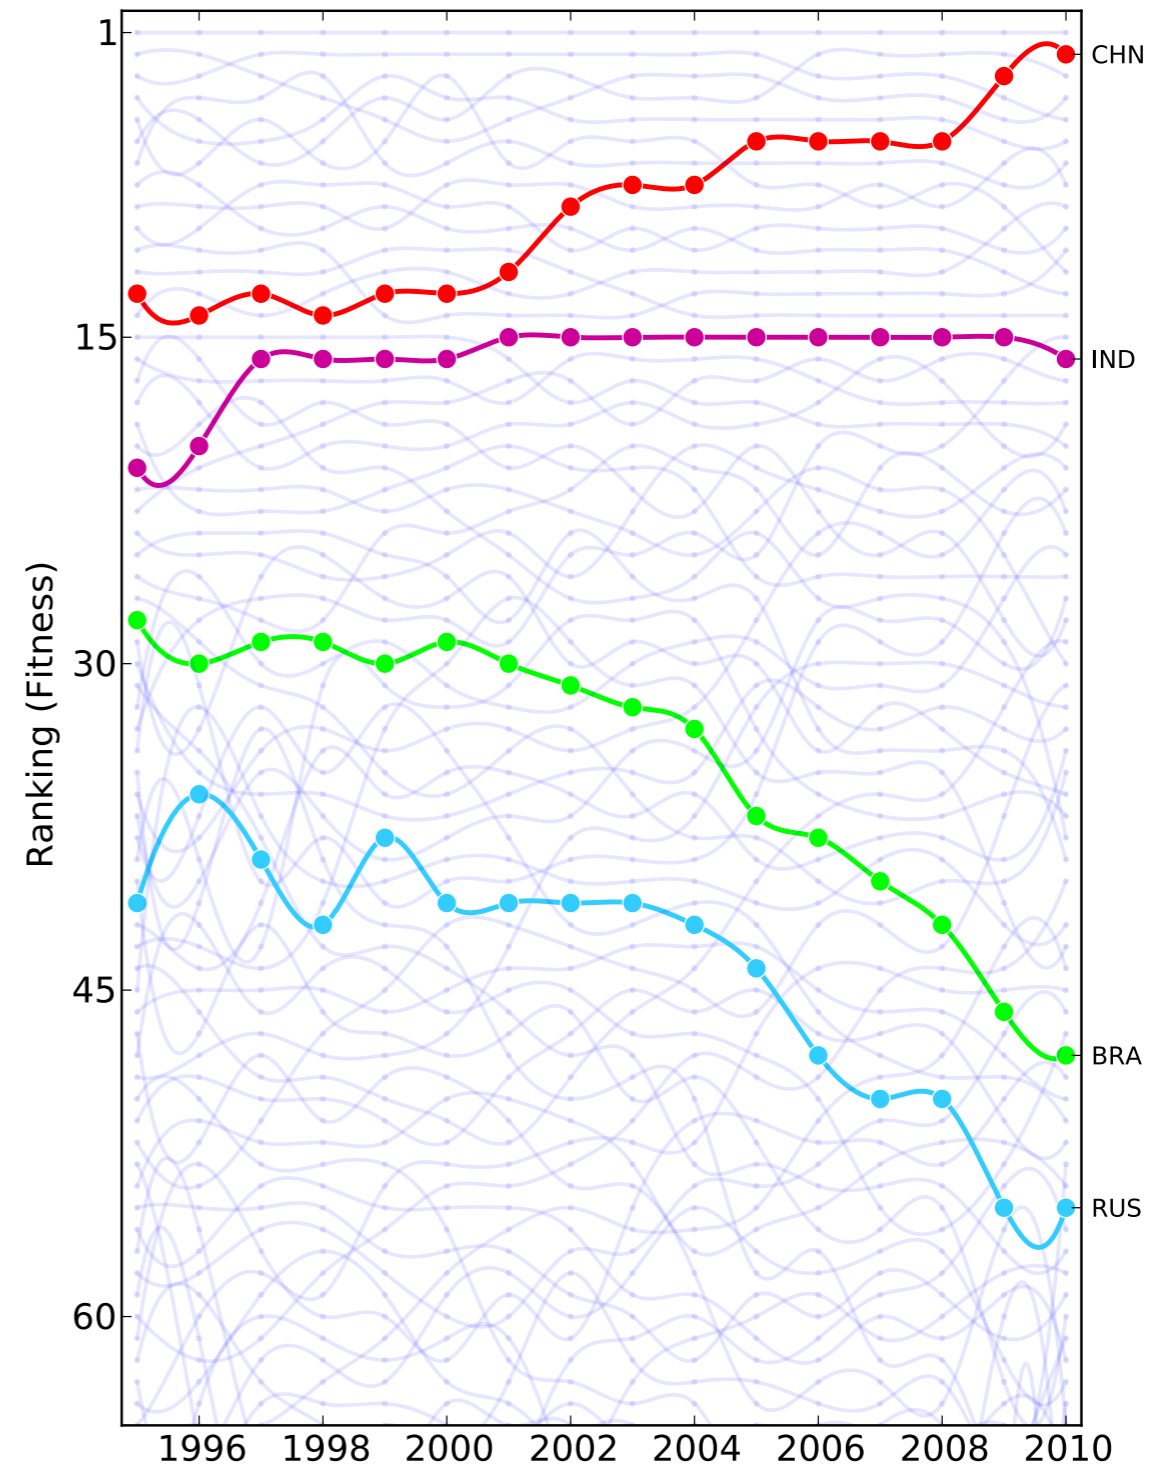

# BRIC – Time Evolution (1995–2010)

GDP is not enough

GDP

Fitness

Key challenge 2

how to forecast  
economic growth

**SCIENTIFIC GROUNDING OF ECONOMIC  
PREDICTION**

(beyond std tools and Reinhart and Rogoff excel-gate)

M. Cristelli, A. Tacchella, L. Pietronero, *The Heterogenous Dynamics of Economic Complexity*, (Working paper)

# FITNESS vs GDP<sub>pc</sub>

Red Line: average trend, NOT a regression

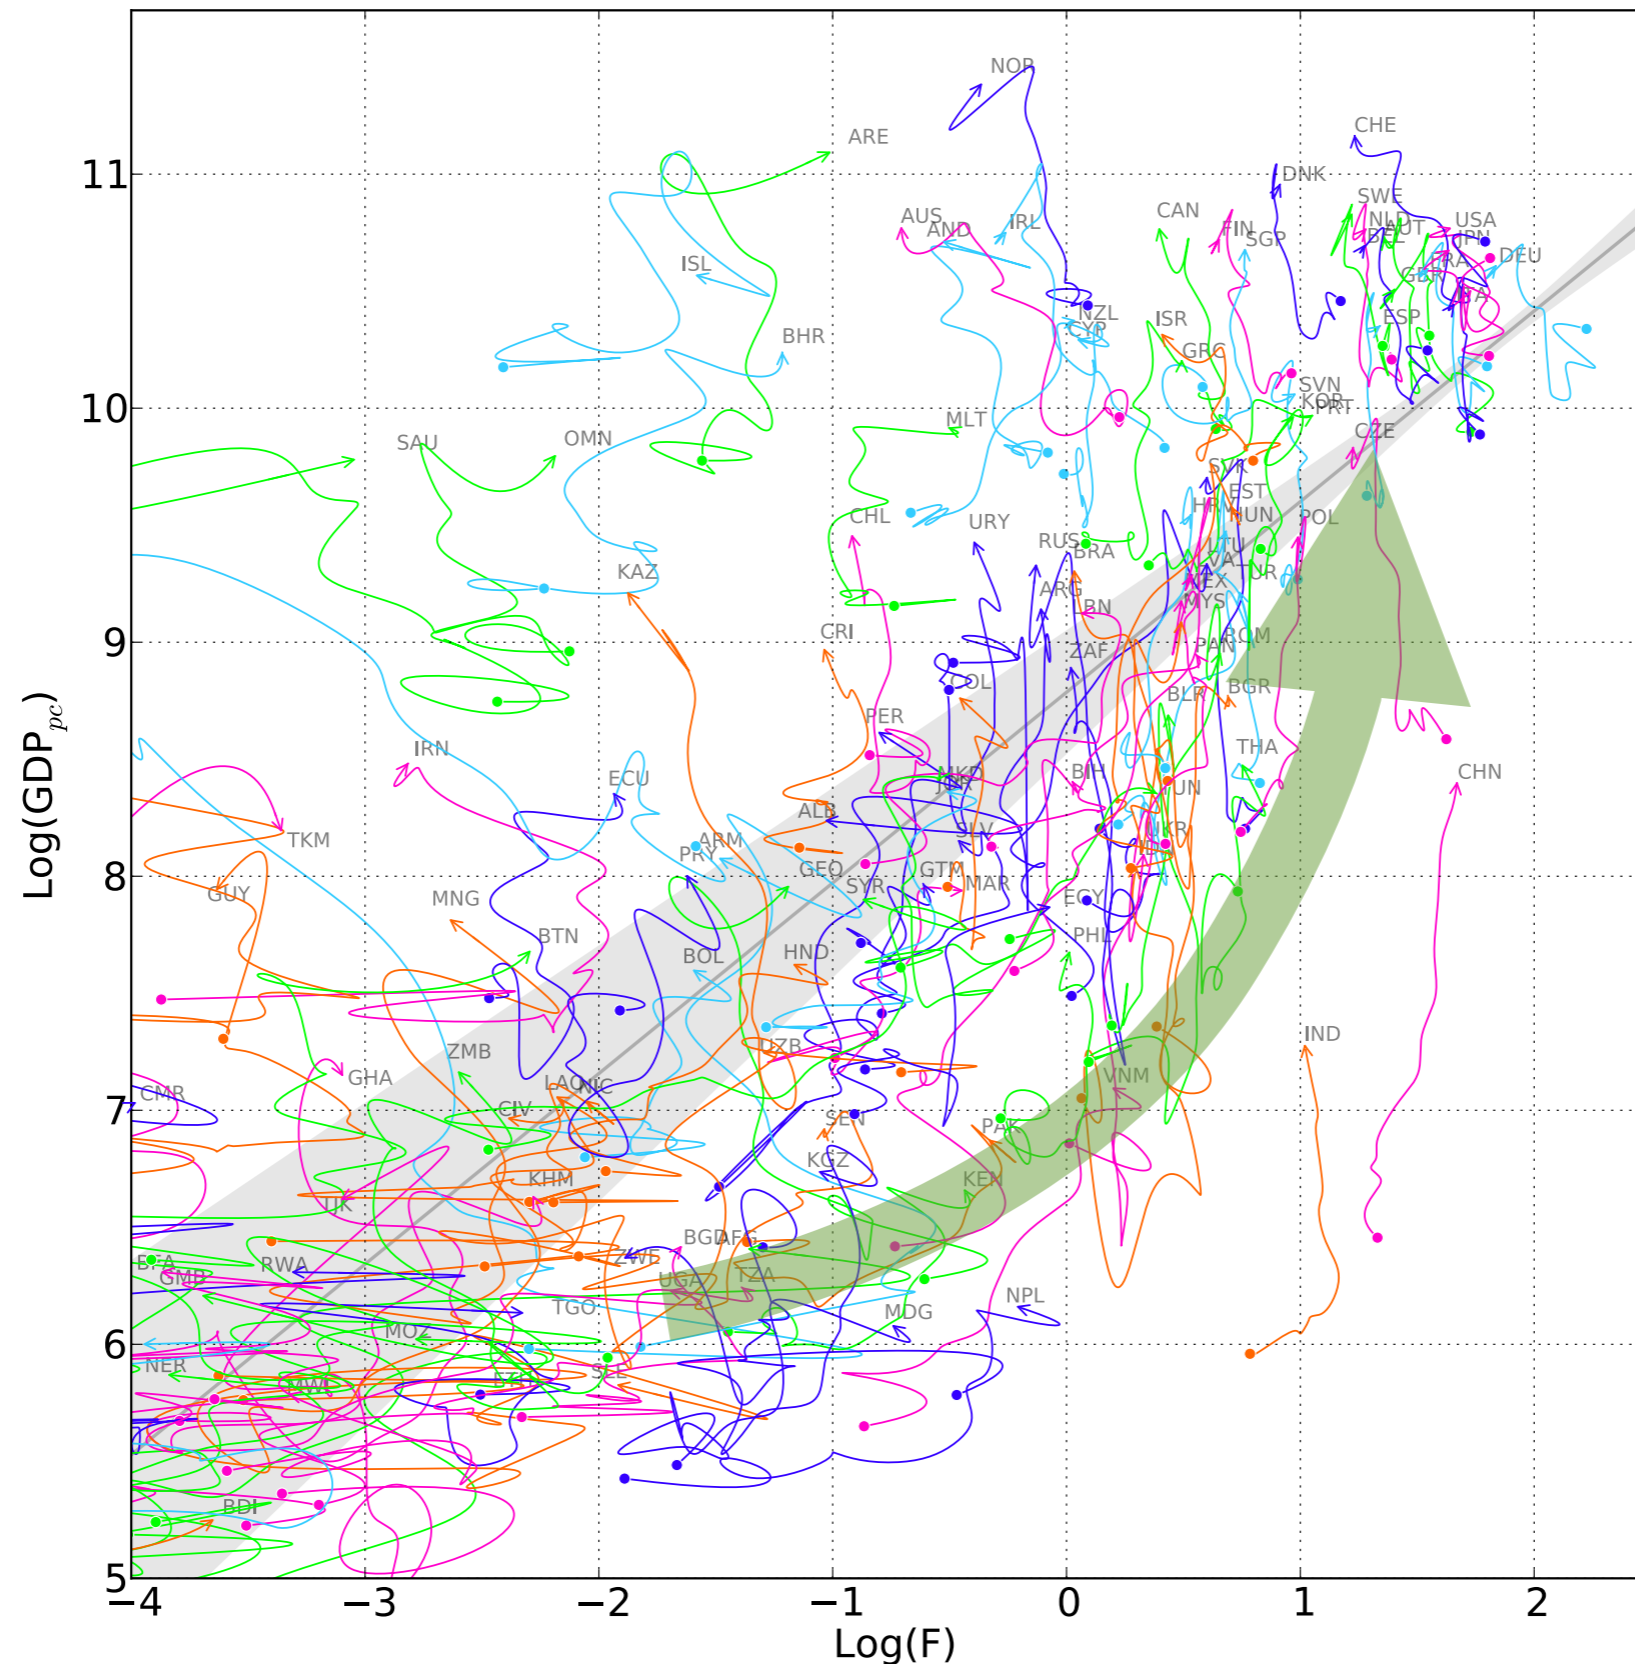

“HOW MUCH YOU EARN”

“HOW GOOD YOU ARE”

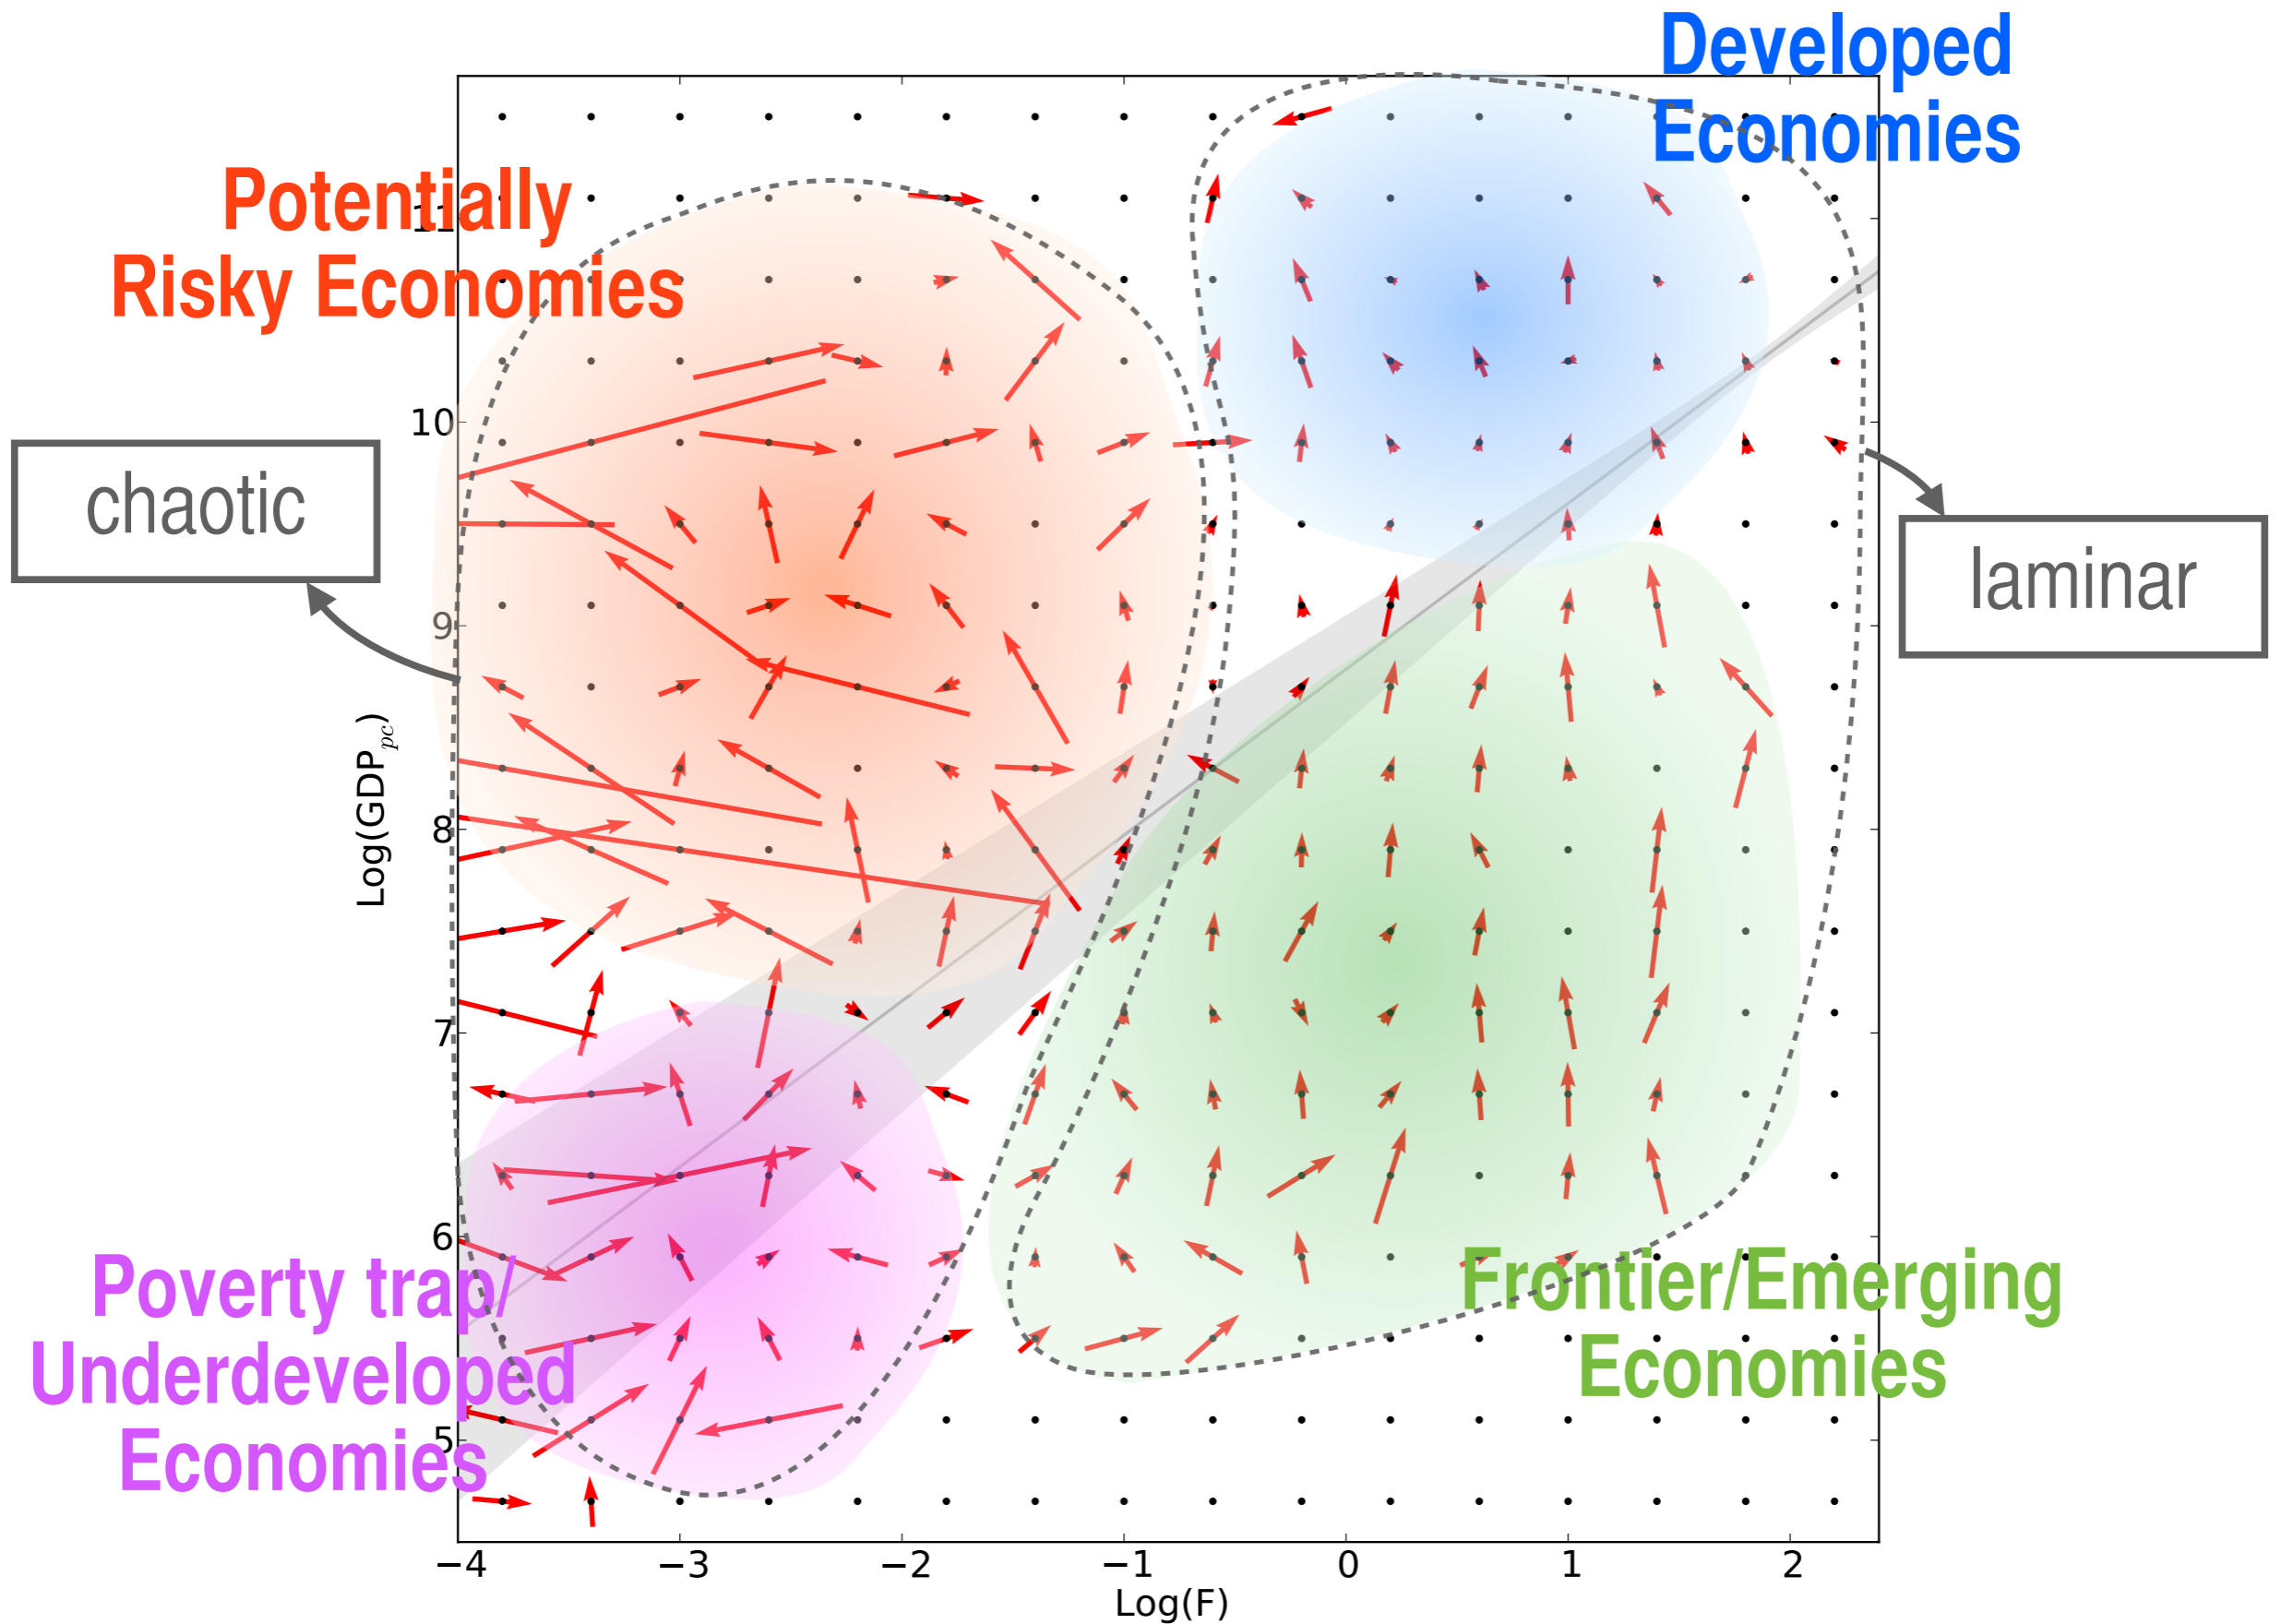

# Collective dynamics ... a mess but not everywhere

# Weather-like forecast

# Weather-like forecast: Heterogeneous dynamics

# Weather-like forecast: Heterogeneous dynamics

# Borrowing concepts from dynamical systems

## Laminar regime

Low effective dimension ( $d_e \approx 2$ )

Fitness is the relevant and driving variable for the economic dynamics in this regime

## Chaotic regime

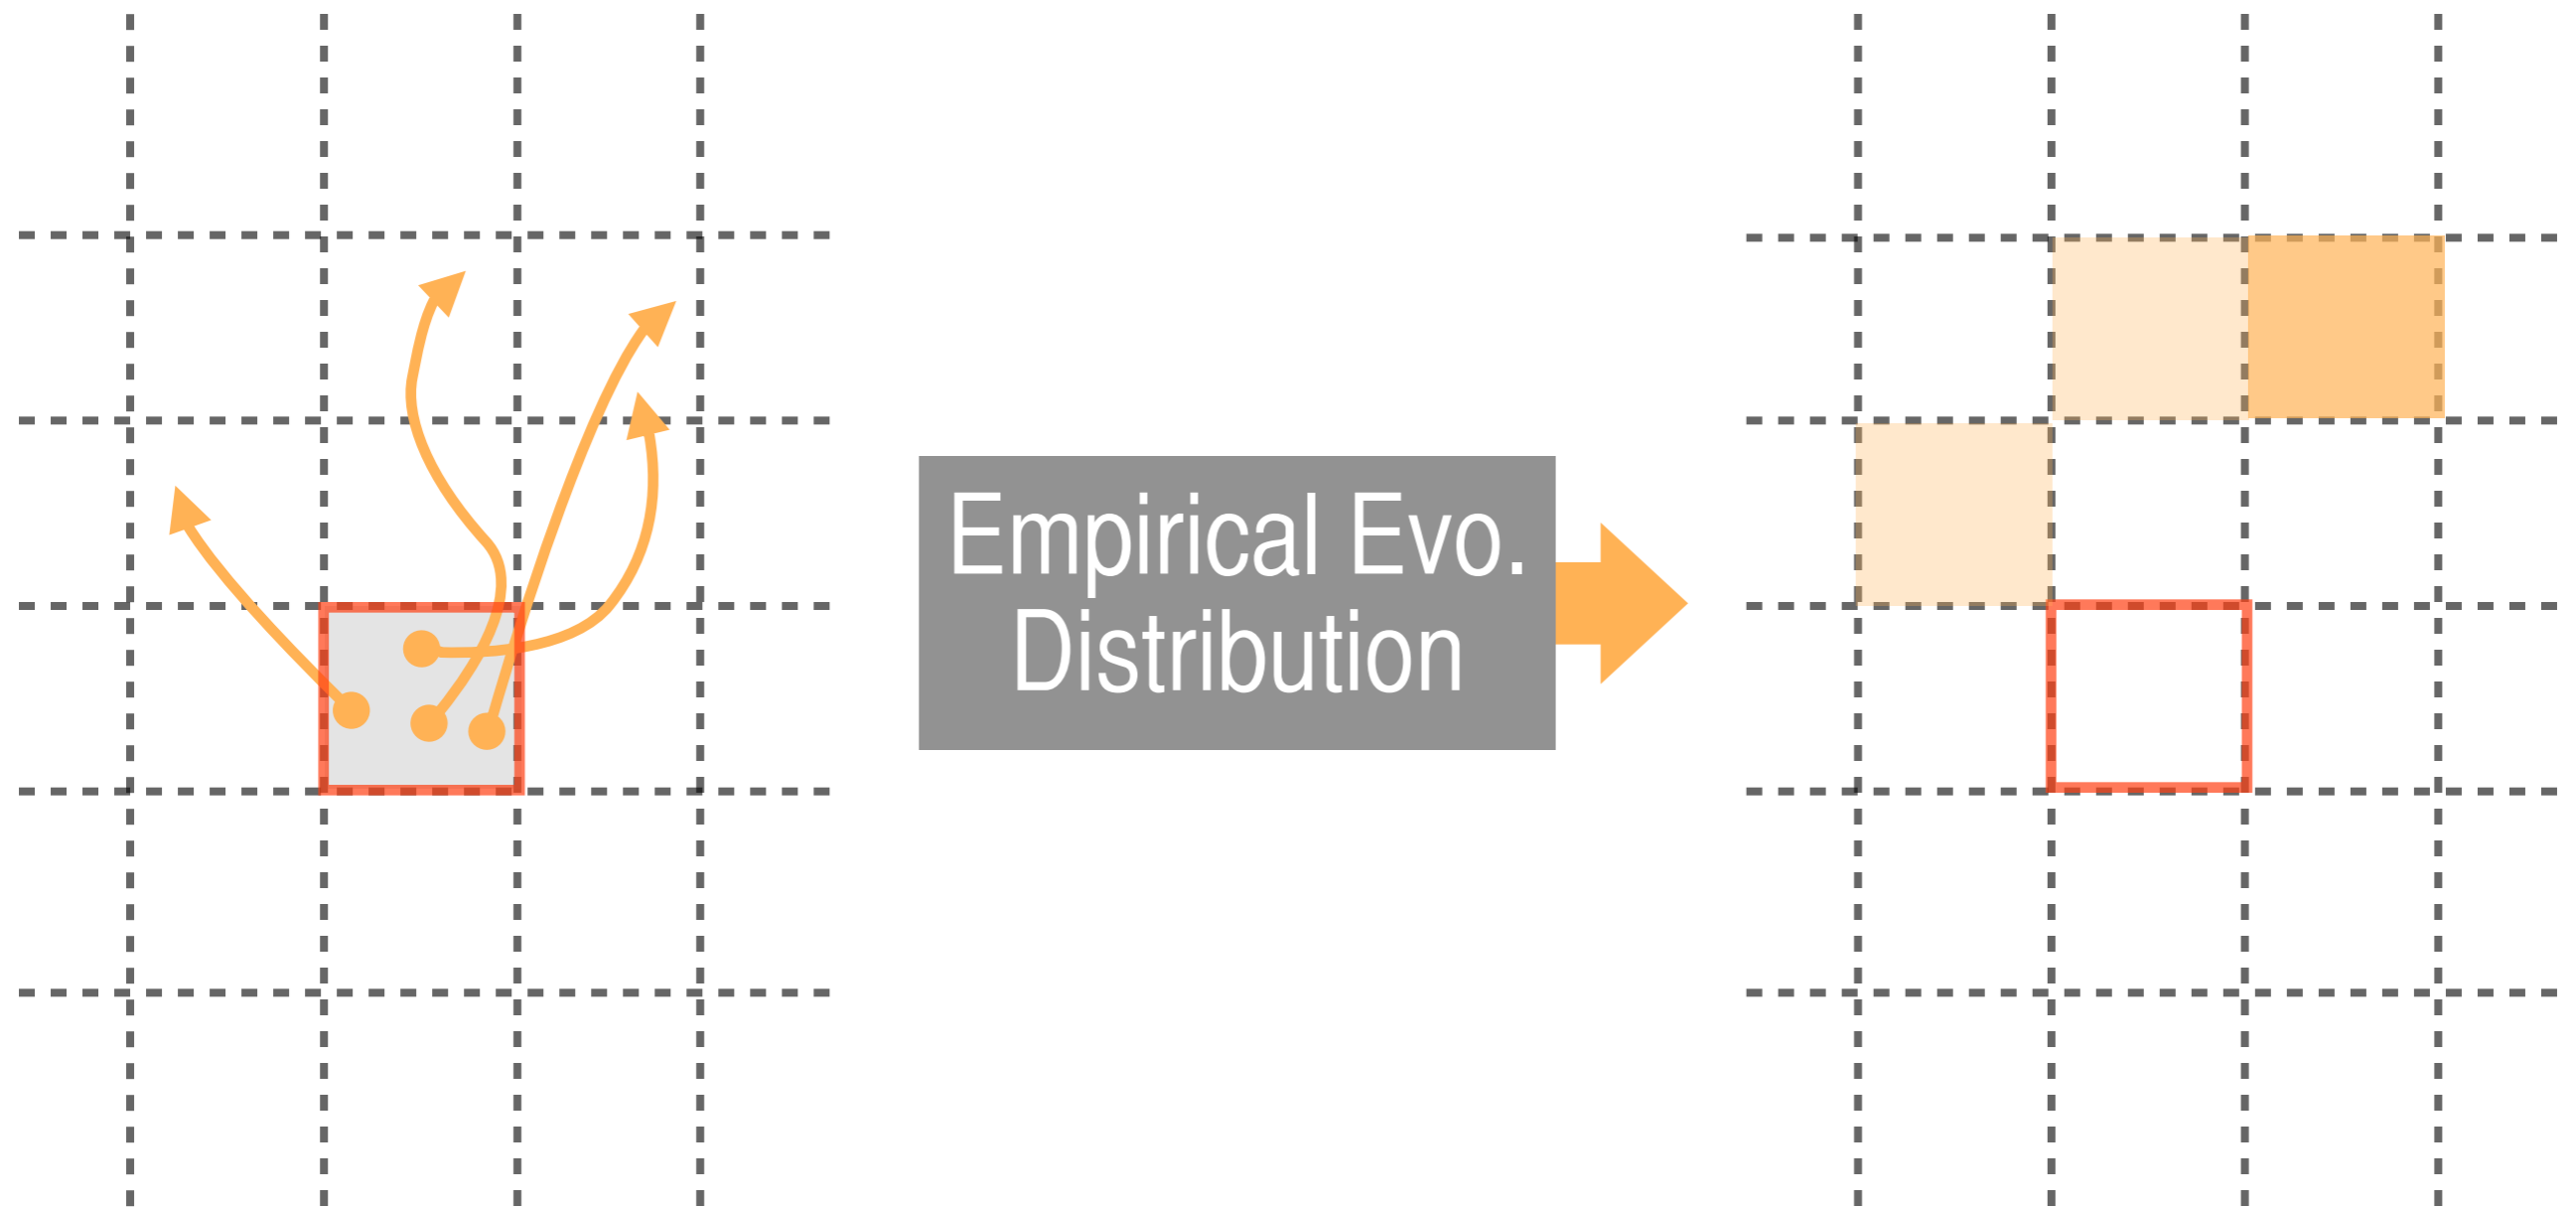

Chaotic dynamics OR  $d_e \gg 2$

Dynamics is ruled by several other exogenous factors competing with Fitness

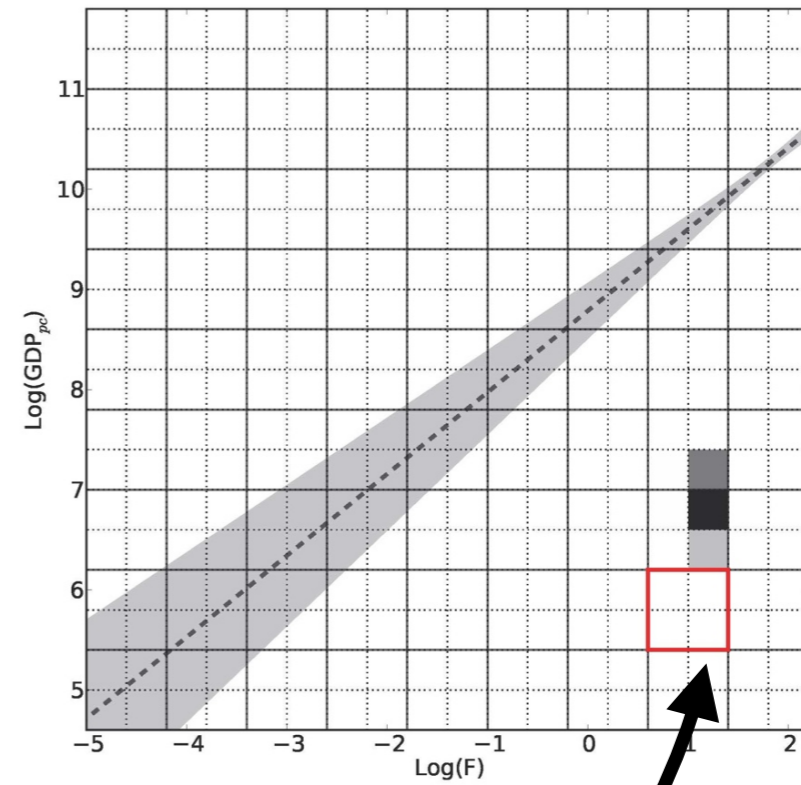

# SELECTIVE PREDICTABILITY

# Method of Analogs: forecasting the future by the knowledge of the past

# the *Selective Predictability* Scheme

$$c = \frac{n_{\text{boxes}}^{(i)}}{N^{(i)}} - \frac{1}{N^{(i)}}$$

NB:  $N^{(i)} \geq 10$
